

## Appendix A. N-way Design Rational

After the integration process, as shown in Figure A.10, POLYMER provides users with merging documentation, referred to as NDR (N-way Design Rationale). This documentation allows users to verify the equivalence of elements during the merge. For example, in the tenth row of Figure A.10, the user confirms that the class Staff from version V1 is equivalent to Personnel from another version.

It's important to emphasize that the algorithms integrated into POLYMER are deterministic. This means that if the merging process is executed with the same inputs, it will consistently yield the same results. Similarly, Reuling's N-way merging approach [16] also exhibits this deterministic behavior, ensuring reliable and reproducible outcomes in both merging processes.

The screenshot shows the 'Design Rational Window' with a table of merging decisions and a 'Merger Report' section. The table has columns for Element, Type, Rule, BaseModel, Version1, Version2, and Version3. Row 10 is highlighted in red, showing 'Staff' as a Class, Rule 'Ours', and Version1 as '(✓)' while Version2 and Version3 are '(X)'. The 'Merger Report' section shows system information and a 'Save' button. A red arrow points from the 'Save' button in the report to the 'Save' button in the table's footer.

(#)	Element	Type	Rule	BaseModel	Version1	Version2	Version3
0	University	Package	Octopus	(✓)	(✓)	(✓)	(✓)
1	Student	Class	Octopus	(✓)	(✓)	(✓)	(✓)
2	Teacher	Class	Octopus	(✓)	(✓)	(✓)	(✓)
3	Course	Class	Octopus	(✓)	(✓)	(✓)	(✓)
4	studentID	Property	Octopus	(✓)	(✓)	(✓)	(✓)
5	courseName	Property	Octopus	(✓)	(✓)	(✓)	(✓)
6	take	Association	Octopus	(✓)	(✓)	(✓)	(✓)
7	Grade	Class	Octopus	(X)	(✓)	(✓)	(✓)
8	courseUnit	Property	Octopus	(X)	(✓)	(✓)	(✓)
9	has	Association	Octopus	(X)	(✓)	(✓)	(✓)
10	Staff	Class	Ours	(✓)	(✓)	(X)	(X)
11	teach	Association	Ours	(✓)	(✓)	(X)	(✓)
12	organize	Association	Ours	(✓)	(✓)	(X)	(X)
13	Seminar	Class	Ours	(✓)	(X)	(✓)	(X)
14	Average	Property	Ours	(✓)	(X)	(✓)	(X)

## Appendix B. NML Editor

Figure B.11 illustrates a segment of the integration rules specified for a UML class diagram within the implemented 1010 NML editor. As shown in the Figure, the NML program is structured around two key components: a set of imported models and a collection of merging rules. These rules include `mergeOctopus`, `mergeOurs`, and `transfer`, each playing a specific role in the merging process. This organization of rules allows NML to efficiently manage and merge different model versions.

The image shows a screenshot of a software application window titled "NML Editor". The window has a menu bar with "File", "Edit", and "Run". The main area contains a text editor with a code snippet. The code is written in a syntax-highlighted language and defines three rules: CL\_OctopusA, CL\_OursB, and CL\_Transfer. Rule CL\_OctopusA uses mergeOctopus, mergeOurs, and transfer. Rule CL\_OursB uses mergeOurs, mergeOurs, and transfer. Rule CL\_Transfer uses transfer. The code is as follows:

```
1 import Version1 : "V1.uml";
2 import Version2 : "V2.uml";
3 import Version3 : "V3.uml";
4 import TargetModel : "Target.uml";
5 import BaseModel : "Base.uml";
6 rule CL_OctopusA
7     mergeOctopus v1 : Version1!Class
8     with v2 : Version2!Class , v3 : Version3!Class
9     withBase v0 : BaseModel!Class
10    into vt : TargetModel!Class {
11        vt.name = v0.name ;
12        vt.isAbstract = v1.isAbstract;
13        vt.package = v2.package.equivalent() ;    }
14 rule CL_OursB
15     mergeOurs v1 : Version1!Class
16     with v2 : Version2!Class , v3 : Version3!Class
17     withBase v0 : BaseModel!Class
18     exists_in 2
19     priority P1 : [v1, v2, v3, v0] , P2 : [v3, v2, v1, v0]
20    into vt : TargetModel!Class {
21        vt.name = P1.name ;
22        vt.isAbstract = P2.isAbstract;
23        vt.package = P2.package.equivalent() ;    }
24 rule CL_Transfer
25     transfer vs : Source!Class
26     from Source : (Version1, Version2, Version3)
27     to vt : TargetModel!Class {
28        vt.name = vs.name ;
29        vt.isAbstract = vs.isAbstract ;
30        vs.eContainer.equivalent().packagedElement.add(vt);    }
```

## Appendix C. The usability evaluation

We conduct a workshop to evaluate usability of the proposed approach. The workshop began with a 25-minute introduction to NML, where we explained the language and its editor. We used NML to design integration rules for an example of a UML state machine, which included the original version and three distinct versions of a state machine diagram for a bank ATM system. Participants were then shown different versions of a UML class diagram for a School Management System and asked to answer two sets of questions based on the example.

The first set of questions consisted of five items assessing usability through ease of use (Table C.5). Questions Q1, Q2, and Q3 aimed to evaluate whether participants comprehended the NML structure. The fourth question (Q4) tested participants' ability to choose the appropriate NML rule type, while the fifth (Q5) examined their ability to write correct rules.

The second set of questions, listed in Table C.6, evaluated usability based on three quality characteristics: effectiveness, efficiency, and satisfaction. Assessing NML's usability through quantitative metrics presents challenges, so we defined a usability evaluation model tailored to the NML language. Table C.7 presents the usability evaluation model for the NML language, structured using the Goal Question Metric (GQM) approach. In this model, the usability of NML is evaluated based on the ISO 9241-11 framework, which defines effectiveness, efficiency, and satisfaction as the primary quality characteristics for usability assessment. Additionally, the time spent by each participant on answering the questions was recorded to further analyze the usability and cognitive load. The time data for each participant is visualized in Figure C.12, offering insights into the overall time efficiency of the approach.

Table C.5: The answers to the questions of the workshop

Q#	Question	P1	P2	P3	P4	P5	P6	P7	P8	P9	P10	CA
Q1	How many octopus rules are required for merging only the classes in different versions?	2	2	3	3	3	3	2	2	2	3	2
Q2	How many ours rules are required for merging only the attributes in different versions?	1	2	2	2	2	2	1	1	2	2	2
Q3	How many transfer rules are required for merging only the associations in different versions?	2	1	2	2	2	2	1	1	1	2	1
Q4	Which rule is required to integrate the attribute teacherID in the first and third versions?	Ours	Ours	Ours	Ours	Ours	Ours	Ours	Ours	Ours	Ours	Ours
Q5	Write the appropriate rule for merging class Room in the first, second, and third versions?	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	check by syntax

The answer to questions Q1, Q2, and Q3 can be a *number*  $\geq 0$ .

The answer to question Q4 can be one of the NML types rules.

✓ Means that the participant answered the question correctly.

CA: Correct Answer.

Table C.6: Results of online user survey regarding usability

Q#	Question	P1	P2	P3	P4	P5	P6	P7	P8	P9	P10
Q6	Is the proposed language easy to learn?	3	4	4	4	4	4	4	4	4	5
Q7	How do you evaluate the readability and comprehensibility of NML language?	3	5	5	4	5	4	5	4	4	4
Q8	To what extent are the NML keywords semantic transparent?	3	5	3	4	5	4	4	5	5	5
Q9	To what extent can the integration description language facilitate the integration process?	4	5	4	4	4	4	4	4	5	4
Q10	How useful is the integration description language?	4	4	4	4	4	4	4	5	5	4
Q11	Is the created editor appropriate for writing NML integration rules?	3	4	5	3	3	4	3	3	4	4
Q12	To what extent is the editor user-friendly?	3	4	4	3	4	4	3	2	3	4

Strongly disagree (1)    Disagree (2)    Neutral (3)    Agree (4)    Strongly agree (5)

Figure C.12: Response time of each participant regarding Table C.5

Table C.7: Evaluation model for NML language

Quality characteristics	Goals	Question	Metrics
Effectiveness	Simplicity	Is the proposed language easy to learn?	Satisfaction with help provided
			Time taken to learn
			Number of mistakes while learning
		How do you evaluate the readability and comprehensibility of NML language?	Satisfaction with writing merging rules
			Satisfaction with finding appropriate rules
		To what extent are the NML keywords semantic transparent?	Satisfaction while learning
			Satisfaction while working with rules
			Satisfaction with understandable
Efficiency	Features	To what extent can the integration description language facilitate the integration process?	Number of models provided for merging
			Time taken to write rules
		How useful is the integration description language?	Time taken to merging models
			Satisfaction with reusability of written rules
			Satisfaction with merged model
		How much NML can facilitate the integration process of large models?	Size of models provided for merging
			Satisfaction with covering all scenarios
Satisfaction	Attractiveness	Is the created editor appropriate for writing NML integration rules?	Satisfaction with help provided
			Satisfaction while writing rules
		To what extent is the editor user-friendly?	Satisfaction with interface graphics
			Satisfaction with interface arrangement

## Appendix D. The performance results

The experimental subjects were executed ten times on the proposed approach to ensure consistent and reliable results. Table D.8 provides detailed information about the runtimes of the proposed approach when applied to three different systems: Hospital, Warehouse, and PPU (Pick and Place Unit).

Table D.8: Runtimes of proposed approach on Hospital, Warehouse, and PPU systems.

System	Operation	Run (Proposed Approach)									
		#1	#2	#3	#4	#5	#6	#7	#8	#9	#10
Hospital	Compare	1.93s	0.68s	1.61s	0.62s	1.66s	0.49s	0.53s	<b>0.42s</b>	0.50s	0.56s
	Merge	4.96s	4.20s	4.90s	6.43s	5.16s	4.86s	3.50s	7.38s	5.67s	<b>3.03s</b>

	Merge	1.14s	0.87s	1.73s	0.78s	0.79s	2.88s	0.90s	0.80s	0.80s	<b>0.71s</b>
	Total Process	2.27s	1.25s	2.13s	1.00s	1.04s	3.14s	1.13s	1.05s	1.05s	<b>0.96s</b>

## Appendix E. The scalability results

Table E.9 displays the runtimes for the merging process across ten subsets of the Warehouse dataset, each with a different number of elements. The subsets were generated by randomly modifying the original dataset to include varying proportions of model elements, with sizes ranging from 366 to 3646 elements per subset.

Table E.9: Runtimes of merging process across Warehouse subsets											
Subset	Elements	Run (Proposed Approach)									
		#1	#2	#3	#4	#5	#6	#7	#8	#9	#10
1	366	1.68s	1.17s	1.05s	1.01s	<b>0.80s</b>	1.53s	0.98s	0.87s	0.94s	0.83s
2	730	4.12s	3.27s	4.35s	3.15	3.74s	2.89s	3.53s	2.62s	3.78s	<b>2.56s</b>
